

Historical Nitrate-Nitrogen Contamination in Ground Water at Dairy Facilities

Exhibit Summary

This exhibit contains ground water quality data associated with dairy facilities that are actively discharging wastewater and those that have discharged wastewater in the past but are currently inactive. Of the 168 dairy facilities considered in this exhibit, 144 are currently active and 24 are currently inactive.

The exhibit contains the single highest nitrate-nitrogen concentration in ground water ever documented at each dairy facility. The data does not include the highest concentration associated with each monitoring well; rather it contains only the single highest concentration of nitrate-nitrogen out of all monitored sources at the dairy facility. This is different than the recent quarterly ground water data utilized for NMED Exhibit SKM - 1, which is comprised of nitrate-nitrogen contamination in ground water sampled from multiple monitoring wells associated with multiple sources at each dairy facility.

The laboratory analyses associated with all monitoring well data submitted by dairy facilities is provided in NMED Exhibit SKM - 3.

Historical Nitrate-Nitrogen Contamination in Ground Water at Dairy Facilities

Historical Nitrate-Nitrogen Contamination at Dairy Facilities

Figure 1 below (summarized from the data in Table 1) shows that of the 168 active and inactive dairy facilities;

- 72 % (121 facilities) have had nitrate-nitrogen contamination in ground water during the history of the facility.
- 24.4 % (41 facilities) have never had documented nitrate-nitrogen contamination in ground water during the history of the facility.
- 3.6 % (6 facilities) have never had a monitoring well(s) to assess the potential impacts on ground water quality from contamination sources at the dairy facility.

Figure 1: Historical Nitrate-Nitrogen Contamination at Dairy Facilities

Historical Nitrate-Nitrogen Contamination in Ground Water at Dairy Facilities

Sources of Historical Nitrate-Nitrogen Contamination at Dairy Facilities

Figure 2 below (summarized from the data in Table 2) shows that of the 121 dairy facilities that have historically had nitrate-nitrogen contamination in ground water, the single highest concentration ever reported at each dairy facility is associated with the following sources.

- 52.9 % (64 facilities) have had the single highest nitrate-nitrogen contamination ever reported associated with wastewater impoundments and combination wastewater/stormwater impoundments.
- 37.2 % (45 facilities) have had the single highest nitrate-nitrogen contamination ever reported associated with the land application area.
- 9.9 % (12 facilities) have had the single highest nitrate-nitrogen contamination ever reported associated with stormwater impoundments.

Historical Nitrate-Nitrogen Contamination in Ground Water at Dairy Facilities

Table 2: Sources of highest historical nitrate-nitrogen contamination at dairy facilities.

Discharge Permit No. (DP#)	Current Facility Name	Year Discharge Began	Status	County	Closest City	Permitted Discharge Volume - Gallons per Day (GPD)	Most shallow Depth-to-Water (ft) as of March 2009	Permitted wastewater management practices	Ever had NO ₃ -N contamination in ground water?	Highest NO ₃ -N Reported in Ground Water							
										NO ₃ -N mg/L (std = 10.0 mg/L)	Cl mg/L (std = 250.0 mg/L)	TDS mg/L (std = 1000.0 mg/L)	TKN mg/L	Monitoring Well (MW) Identity	Sample Collection Date	Source Monitored	Upgradient MW NO ₃ -N mg/L
